

Knot Type

You are an expert in physical reasoning and knot behavior analysis. I will provide you with a video of knot manipulation. Your task is to determine whether the knot is a slip knot or a fixed knot. A slip knot is a knot that can be undone or released by pulling one end of the rope. A fixed knot is a knot that cannot be undone by pulling one end and instead becomes tighter or remains fixed. Please observe the video carefully, strictly follow the analysis steps below, and output your final answer in a fixed format.

[Analysis Steps]

1. Structure Observation: Observe the rope configuration, including loops, crossings, and how the knot is formed.
2. Pulling Behavior Analysis: Analyze what happens when one end of the rope is pulled, especially whether the knot loosens, releases, or tightens.
3. Knot Type Determination: Based on the observed behavior, determine whether the knot can be undone by pulling one end.

[Output Format Requirements]

Please strictly adhere to the following XML tag format for your response. Do not add any extra text outside the tags.

<thinking>

Write your detailed reasoning process based on the three steps above here.
